1. INTRODUCTION

The Ecology and Environment, Inc. (E & E) Region VI Field Investigation Team (FIT) was tasked by the U. S. Environmental Protection Agency (EPA) under Technical Directive Document (TDD) F06-9004-03 to conduct a Listing Site Inspection (LSI) of the Houston Gas Light Company (TXD981918188) site in Houston, Harris County, Texas. The EPA subsequently modified the task to require an On-Site Reconnaissance Inspection Report in lieu of the LSI Report.

1.1 LISTING SITE INSPECTION OBJECTIVES

The LSI is the final investigative stage of the pre-remedial process. Only those sites requiring further action after the Screening Site Inspection (SSI) are LSI candidates.

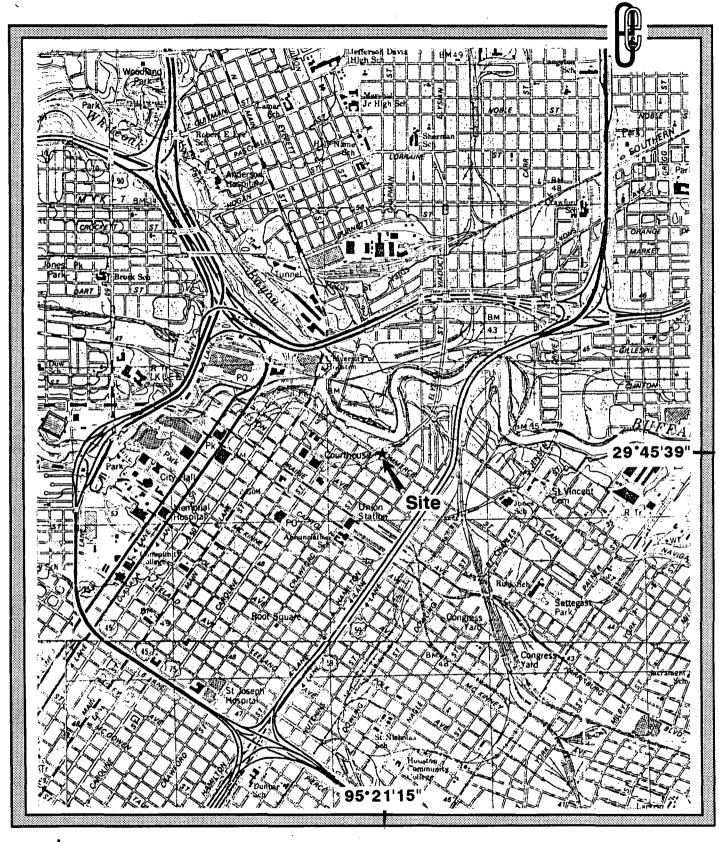

The LSI characterizes the site through Hazardous Ranking System (HRS) documentation. It expands upon information obtained during the SSI and Preliminary Assessment (PA), including SSI and PA reports, HRS PreScores, reconnaissance inspections and analytical data.

1.2 SITE DESCRIPTION

The Houston Gas Light Company (HGL) site is located at 1515 Commerce Street, adjacent to Buffalo Bayou at the north edge of the central business district of Houston, Texas (Figure 1) (Ref. 4, p. 1, Attachment 2, p. 1). The geographic coordinates of the site are 29°45'39" north latitude and 95°21'15" west longitude (Ref. 4, p. 3). The site is an approximately four acre parcel of land which was the former location of a town gas manufacturing plant, operated from the late 1800s to the early 1900s. The site is bounded by Commerce Street on the south and Buffalo Bayou on the north. The Elysian Street Viaduct ramps connect with LaBranch Street to the west and Crawford Street to the east (Ref. 4, p. 11, Attachment 1, Attachment 2, p. 9). The southeast corner of the site is currently utilized by ENTEX, the successor company to HGL, as a natural gas metering and distribution facility (Ref. 12). remaining portion of the land between the Elysian Street Viaduct ramps is covered by a Harris County warehouse and parking lot (Figure 2) (Photographs).

ENTEX (a division of Arkla, Inc.) headquarters are located at 1600 Smith Street, P. O. Box 2628, Houston, Texas 77252-2628 (713/654-5555). Permission to conduct the on-site reconnaissance inspection was granted by Senior Vice President William L. Clayton (Ref. 13).

HGL was organized in 1866 and entered an agreement with the City of Houston in 1868 to light 75 street lamps. HGL was reorganized as the Houston Gas Company in 1905 and was succeeded by the Houston Gas and Fuel Company in 1911 (Ref. 2). The capacity of the gas manufacturing plant was 1,500,000 cubic feet in 1905 (Ref. 1). In 1917, an average of one car of coke per day was used to manufacture gas (Ref. 3). Natural gas was introduced into the city mains in May 1926. Houston Gas and Fuel Company merged with United Gas in 1937. United Gas, Inc. voted to change its name to ENTEX on March 28, 1974 (Ref. 2).

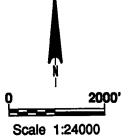

FIGURE 1 SITE LOCATION MAP HOUSTON GAS LIGHT COMPANY HOUSTON, TEXAS TXD981918188

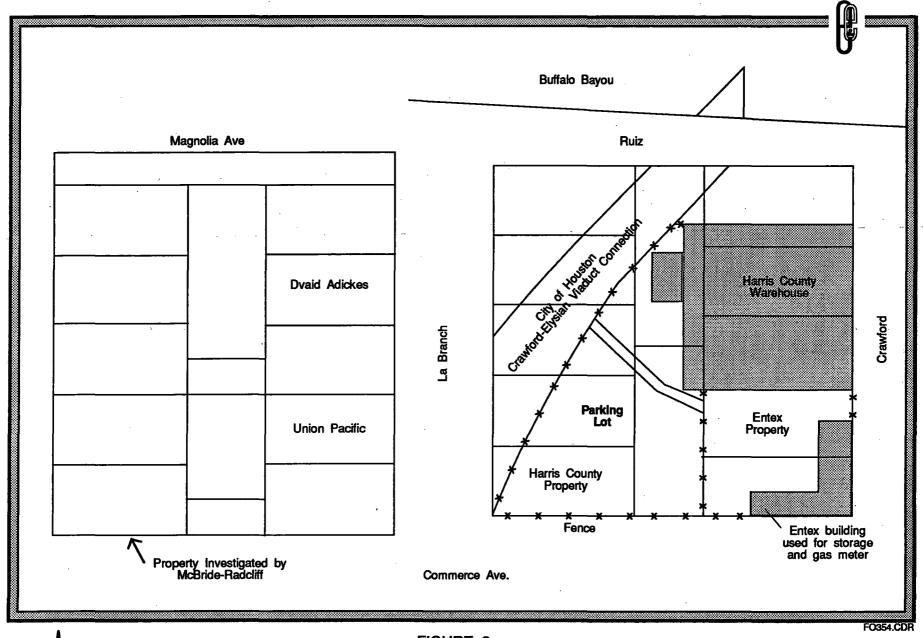

FIGURE 2
SITE SKETCH

Facilities similar to HGL manufactured gas from coke at the site for illumination, cooking and heating. These plants produced a variety of wastes, some of which may have been disposed of on-site (Ref. 4, p. 11). No information on HGL waste handling and disposal practices has been A PA of the site was conducted by the Texas Water Commission (TWC) on December 5, 1986. A site inspection (SI) was not planned at that time because the entire property was covered by buildings or On April 6, 1988, McBride-Ratcliff and Associates, Inc. pavement. TWC regarding the HGL site (Ref. 4, p. 11). McBride-Ratcliff had just completed an investigation of an adjoining property in which it had detected polynuclear aromatics in samples collected from site investigation borings. The polynuclear aromatics reported by McBride-Ratcliff are commonly found in coal tar wastes from town gas manufacturing plants (Ref. 4, Attachment 2, pp. 13-14).

2. DATA REVIEW AND DATA COLLECTION

A TWC PA of the site was finalized on December 5, 1986, and a TWC SI, based on information obtained during the McBride-Ratcliff investigation of the adjoining (west) property, was completed on September 14, 1988 (Ref. 4, p. 1).

On December 5, 1990, the FIT conducted an on-site reconnaissance inspection to collect background data and to identify potential waste sources and targets. The FIT was comprised of Michael N. Mitchell and Greg Straughn. The ENTEX representative present during the inspection was Lanny W. Cargile, P.E., Operations Engineer. Photographs taken during the on-site reconnaissance inspection are included in Attachment A.

3. PATHWAY CHARACTERISTICS

The following sections characterize waste sources and migration pathways.

3.1 SOURCE WASTE

No historical information has been found regarding waste handling or disposal practices of HGL coal gasification operations at the site. A copy of the circa 1900 Sanborn fire insurance map included with the TWC SI shows the relative position of structures at the site and adjacent facilities (Figure 3). An underground oil storage tank and a surface coal pile are shown on the map, but waste handling areas are not indicated (Ref. 4, Attachment 1). The majority of the site is occupied by gas manufacturing structures, which would have left very little space to be accumulated or disposed of on-site. McBride-Ratcliff investigation of the adjoining (west) property revealed polynuclear aromatic hydrocarbons approximately 11 feet below ground level in several of the borings (Ref. 4, Attachment 2, pp. 8, 13). Semivolatile organics extended 30 to 42 feet deep in Boring CB-5 Naphthalene was reported at 4,235 ppm from a sample collected from Boring CB-4 (Ref. 4, Attachment 2, pp. 8, 13). The exact location and amount of waste at the site are unknown. No known waste is exposed at

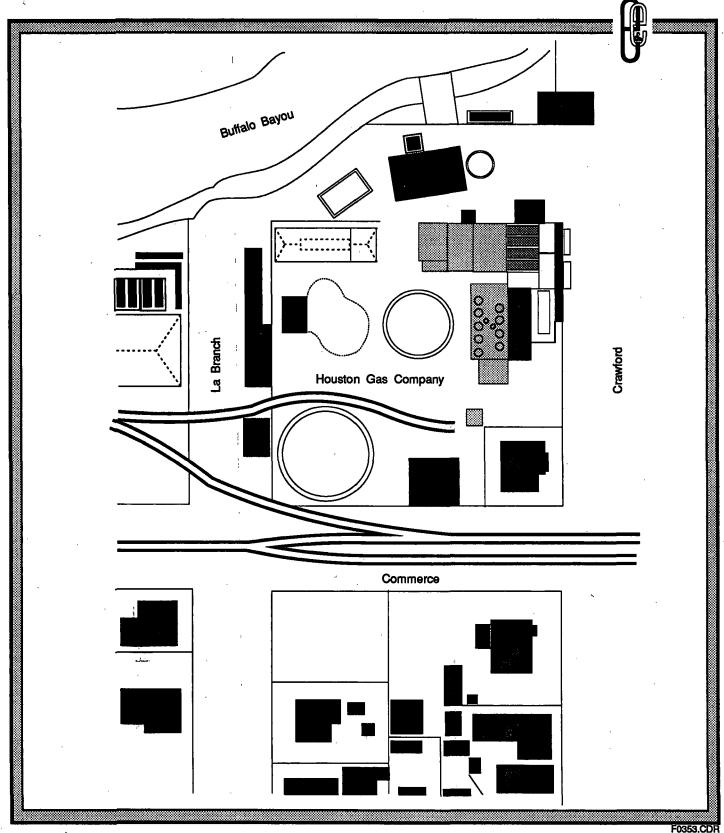

FIGURE 3
SANBORN FIRE INSURANCE MAP (CIRCA 1900)
HOUSTON GAS LIGHT COMPANY

HOUSTON, TEXAS TXD981918188 the surface and the majority of the site is covered by buildings or paved parking lots.

3.2 GROUND WATER

The HGL site is located on fill materials overlying surficial deposits of the Beaumont Formation, which is one of the units which comprise the Chicot aquifer (Ref. 4, Attachment 2, p. 11; Ref. 5; Ref. 6, p. 10). The water table was encountered from 28 to 34 feet below land surface in several on-site boreholes (Ref. 4, Attachment 2, p. 12). Underlying the Chicot aquifer is the Evangeline aquifer, which is the principal source of ground water in the Houston area (Ref. 6, p. 10). Approximately 50 percent of the City of Houston's water is produced from water wells (Ref. 7). Water production from the Evangeline aquifer in the vicinity of the site ranges from depths of 700 to 2,000 feet. The City of Houston has nine production wells within a four mile radius of the site (Ref. 14). The nearest well is located 1.4 miles west of the site (Ref. 8).

Analytical data shows organic contaminants extending from the unsaturated zone beneath the site to below the water table. Contaminants in the ground water include acenaphthene (31 ppm), acenaphthylene (28 ppm), anthracene (24 ppm), benzo(a)anthracene, chrysene (7ppm), fluoranthene (30 ppm), fluorene (60 ppm), naphthalene (435 ppm) phenanthrene (123 ppm) and pyrene (144 ppm) (Ref. 4, Attachment 2, pp. 7, 8, 12, 13).

3.3 SURFACE WATER

The northern boundary of the HGL site is formed by the bank of Buffalo Bayou. The north edge of the site is located within a 500 year flood zone (Ref. 9). Buffalo Bayou downstream from the site is tidal and the only designated uses are navigational and industrial/cooling water supply (Ref. 10, p. 51). There are no drinking water intakes located within the 15 mile downstream segment (Ref. 10, p. 51). There are no known fishery, or sensitive environment, target populations near the site. The two year, 24 hour rainfall for the area is 5 inches (Ref. 11).

3.4 SOIL EXPOSURE

The majority of the site is currently covered by buildings or parking lots. The southeast corner of the site is utilized by ENTEX as a natural gas metering and distribution facility. The north and west portions are covered by a Harris County warehouse and asphalt paved parking lot. The McBride-Ratcliff report of the adjoining (west) property indicated that an average of 19 feet of fill material were present and ranged from nine to 33 feet thick. Black asphaltic materials were reportedly found in four soil borings at approximately 11 to 13 foot depths. The asphaltic material was overlain by relatively clean construction debris and fill soils (Ref. 4, Attachment 2, p. 15). No hazardous waste appears to be exposed at the surface.

3.5 AIR

Due to the depth of burial of site waste (11 to 13 feet), and the current use of the property (covered by streets, parking lots or buildings), the air pathway is not a route of concern.

4. CONCLUSIONS

HGL operated a town gas manufacturing plant at the site from approximately 1866 to 1926. As part of its operations, HGL may have disposed of coal tar wastes at the site. Analysis of samples from soil borings drilled during the investigation of the adjoining (west) property indicated that polynuclear hydrocarbons were present in four borings at the west edge of the site, at depths from approximately 12 feet to below the water table. The northern boundary of the site is the bank of Buffalo Bayou. In the vicinity of the site, the water from Buffalo Bayou is used only for navigation and industrial cooling water. The nearest drinking water supply well is located 1.4 miles west of the site, and produces from the Evangeline aquifer between depths of 747 to 1,990 feet.

HOUSTON GAS COMPANY

There has probably been no invention in the world for the past number of years which has been of more material benefit to mankind in general than the manufacture of artificial gas. It has had the effect of furnishing a clean and effective fuel heretofore unknown to the world and a light which has no superior. The benefit and effectiveness, however depends largely upon the class of the plant and in this Houston has been particularly fortunate.

The Houston Gas Company was first organized in 1866 when the town was little more than a village, and, properly speaking was not in that class of cities which were enjoying this unusual advantage. A representative number of citizens headed by the lamented T. W. House, Sr., got together on this as they did many other things, and began to give Houston some of the advantages that were enjoyed by the more populous cities of the North. They had a hard struggle of it, but were men who did not know what the word fail meant and as a result today Houston has one of the most efficient gas plants in the South.

Their plant, however, since that time ...as undergone many changes for the better and only a few years ago was practically entirely rebuilt with a capacity sufficient to meet the wants of a greater Houston. Their present capacity is 1,500,000 cubic feet which is far shead of the requirements at the present time and will meet the needs of the city for some years to come. Like their first effort, the company foresaw the coming greatness of the city and based their calculations accordingly. They have fifty miles of mains running to every section and supplying the entire city with gas for heating and lighting purposes. Their gas plant is located at the corner of Commerce and Crawford streets and is modern in every particular. It is equipped with all the latest appliances for turning out a pure and highly commercial gas for all purposes. This is furnished the citizens of Houston at a rate under a great many of the leading cities of the South. Their service is excellent in every respect and there is hardly a first-class residence or business house in the city which is not connected with their mains. They also handle a complete line of gas fixtures, including stoves, chandallers and all the latest appliances for

OFFICE OF HOUSTONIGAS COMPANY

the safe and economical use of gas in any form.

They have handsome offices and salesrooms at 604 Main street, near the central part of the business district of the city and have on exhibition at this place a complete line of their appliances and fixtures.

The Houston Gas Company is capitalized at \$600,000, with the following officers: T. W.

House, president; Jas. A. Baker, Jr., vice president; C. H. Dunbar, secretary and general manager.

Mr. Dunbar, the general manager, came from Elgin, Illinois, some five months ago to assume charge of the plant and his energy and experience has already made itself manifest in the excellent service which is being given at the present time. There is

not another public utility in Houston which has given more universal satisfaction than the Houston Gas Company and under its present management it will continue to be an industry of which she may well feel proud. Mr. Dunbar has had charge of several of the leading gas plants of the country and he is a master of every detail of the

PAGE: 10 OF 10

Site Name: Houston Gas Light Company

Town gas plants were utilized throughout the United States in the late 1800s and early 1900s to manufacture gas for illumination, cooking, and heating purposes. These plants produced an array of wastes that may have been disposed of on-site. As natural gas became available, the use of the facilities which produced manufactured gas decreased. The environmental concerns associated with these facilities include products/by-products that may not have been utilized and were left in place during closure, wastes that were deposited on-site, and the potential for leaching of these wastes into soils and ground water.

The exact location of the Houston Gas Light Company was determined by researching state archives for old city directories to determine the address of the manufacturing plant and the approximate years of operation. The University of Texas Barker Collection archives contains historic Sanborn fire insurance maps which were used to determine the location of the site and identification of various landmarks which could be related to present day conditions. Due to the extensive changes in the city over the past eighty or a hundred years, it was advantageous to locate a current city map and attempt to relate the circa 1900 Sanborn maps to a current city map.

The present owner/operator of the property on which the old town gas site was located is Entex Gas Company. This is an active concern that uses the site as a maintenance/office complex. A large building covers most of the area of the old town gas site. No attempt was made to contact the owner/operator. The property to the west is owned by David Adickes (northern part) and Union Pacific Company, (southern part).

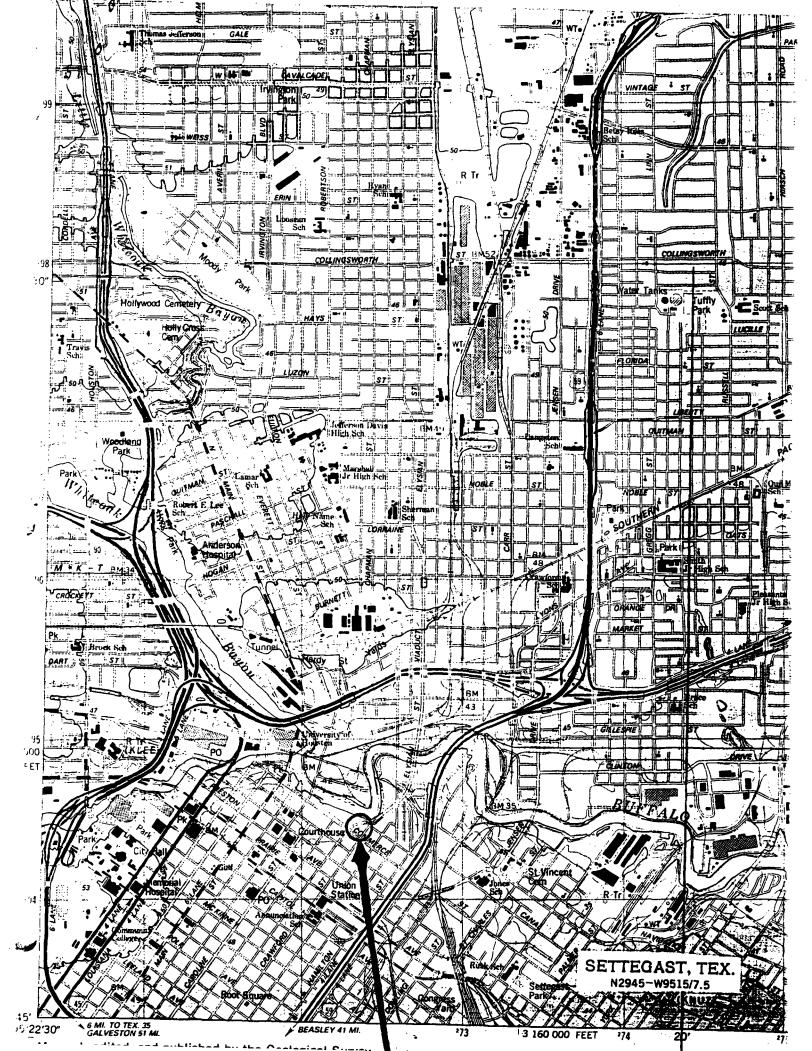

A Preliminary Assessment (PA) of the site was conducted December 5, 1986 by the TWC. The entire property that was the Houston Gas Light Company is covered by buildings and pavement, therefore no Site Inspection (SI) was planned.

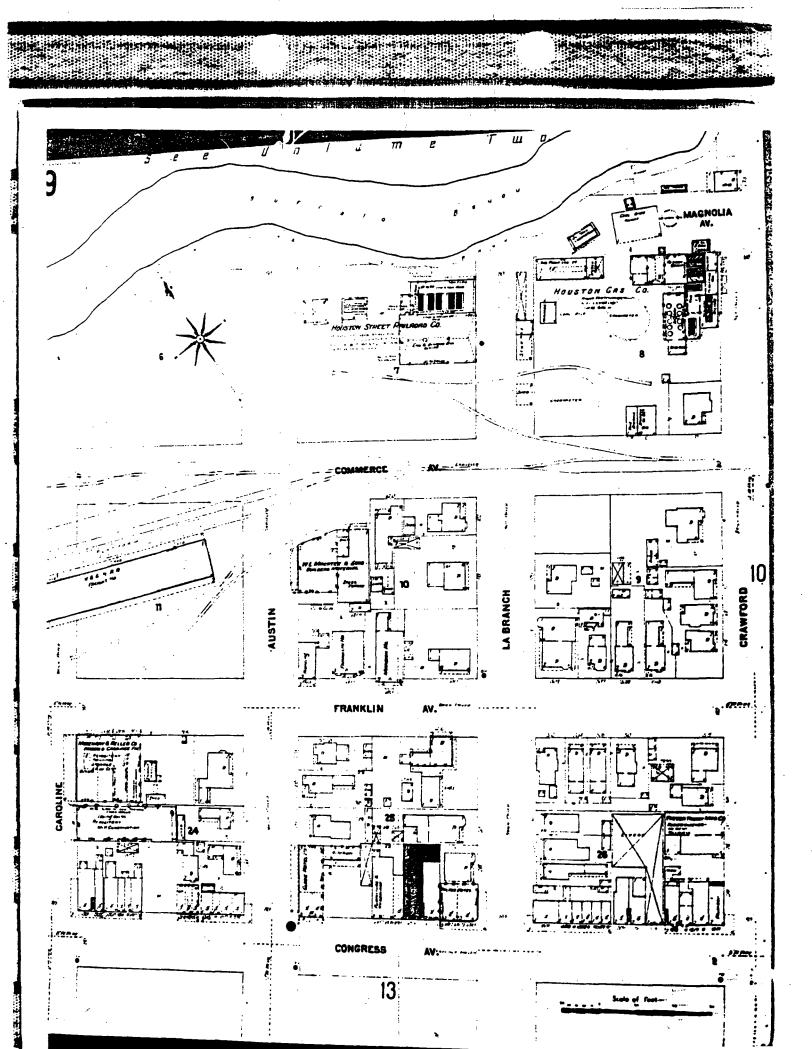

McBride-Ratcliff and Associates, Inc., contacted the TWC on April 6, 1988 regarding the Houston site. They conducted a PA and collected samples for Parkway Detention/Parkway Investments who were considering developing the property. Thirteen soil borings were auger drilled, to depths ranging from 14 to 80 feet. Their report is included as attachment 2.

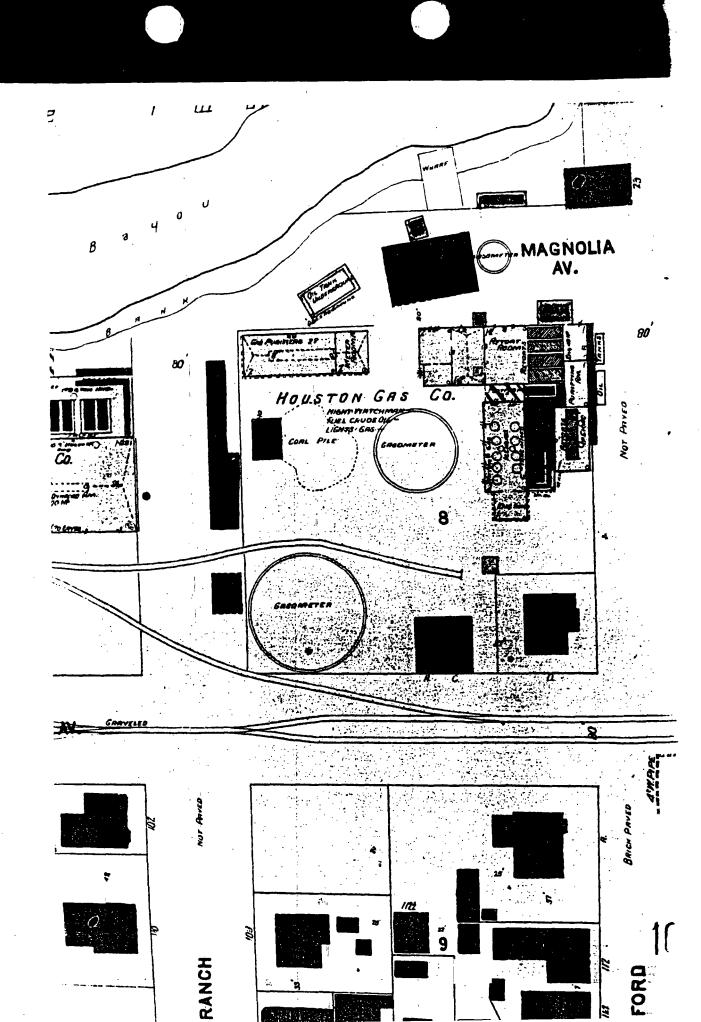

The analytical results indicate high levels of polynuclear aromatic (PNA) compounds. Naphthalene was found at a concentration of 4235 mg/kg, Phenanthrene at 1838 mg/kg, and Anthracene at 1218 mg/kg. Other high concentration PNAs were found. These compounds are characteristically found in manufactured gas plant tars. These PNAs are also nearly always found in soils and are produced by virtually every combustion process. In urban soils, PNAs range from 100 to 175 mg/kg (USEPA 1982). The range of PNA concentrations at the Houston site are well above the range of urban soil background levels.

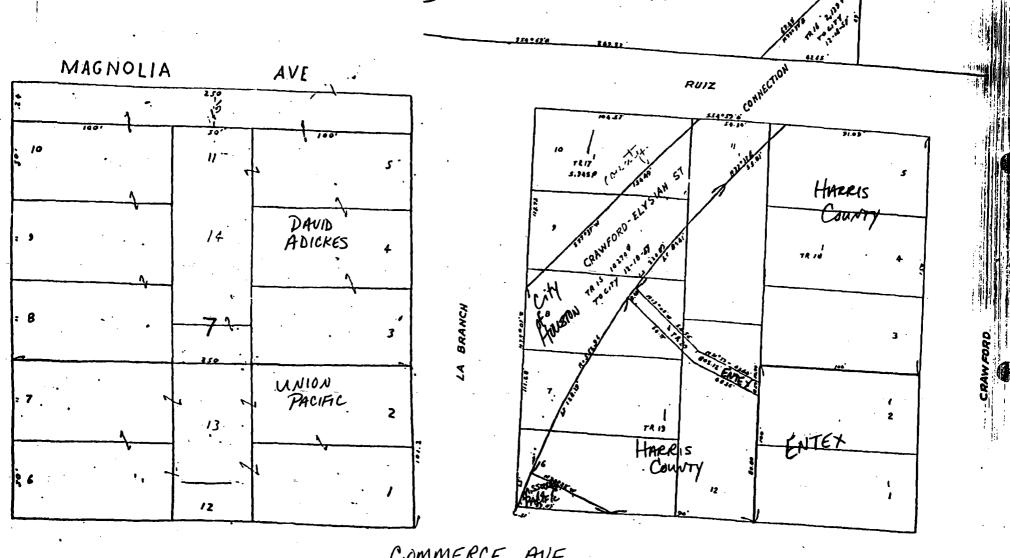

The concentrations of PNAs at the Houston site are very high however the ground water and surface water in the area are not used for drinking water. Therefore this site is recommended to be considered as a medium level concern.

SUBJECT:

Preliminary Environmental Site Assessment

Commerce Street Site

Houston, Texas

Presented herein is the report of our preliminary environmental site assessment for the Commerce Street Site located in Houston, Texas. This preliminary assessment included a general evaluation of the potential presence of subsurface organic soil contaminants for an approximate 1.43-acre site located at Commerce Street and LaBranch Street in Houston, Texas. This study was authorized on March 22, 1988 and was conducted in general accordance with our proposal dated March 2, 1988 (MRA Proposal No. 88-P046). Preliminary reports of our initial findings were submitted on March 23, 1988 and April 8, 1988.

We appreciate this opportunity to be of service. Please call if you need any additional project information.

Sincerely,

McBRIDE-RATCLIFF AND ASSOCIATES, INC.

SUMMARY AND RECOMMENDATIONS

Ü

The principal findings and conclusions of our preliminary environmental site assessment for the Commerce Street Site are summarized as follows:

- 1. According to historic site maps, the Commerce Street Site is shown as the former location of the Houston Electric Company. Adjacent to the Commerce Street Site is the former location of the Houston Gas and Fuel Company. According to the Texas Water Commission (TWC), the Houston Gas and Fuel Company site is listed as a former town gas site which produced coal-tars as a by-product of coal gasification for fuel.
- 2. The Commerce Street Site is underlain by intermixed clay, gravel, concrete, and asphaltic fill materials to an average depth of 19 ft, with maximum fill material depths to 33 ft. Water levels in open boreholes were encountered at about 28 ft to 34 ft during the time of our study and are generally lower than regional groundwater levels, presumably as a result of drawdown caused by the proximity of the site to Buffalo Bayou.
- 3. Laboratory organic vapor headspace measurements indicate organic contaminants in both fill materials and natural soils extending to depths of 48 ft. Polynuclear aromatic hydrocarbons and PCBs were detected in five tested soil samples from both the fill materials and the natural soils.
- 4. We interpret the average depth to residual fill soil contaminants (i.e., oily residues and asphaltic material) to be about 11 ft at four boring locations.
- 5. We recommend that a copy of this report be submitted to the Texas Water Commission.

INTRODUCTION

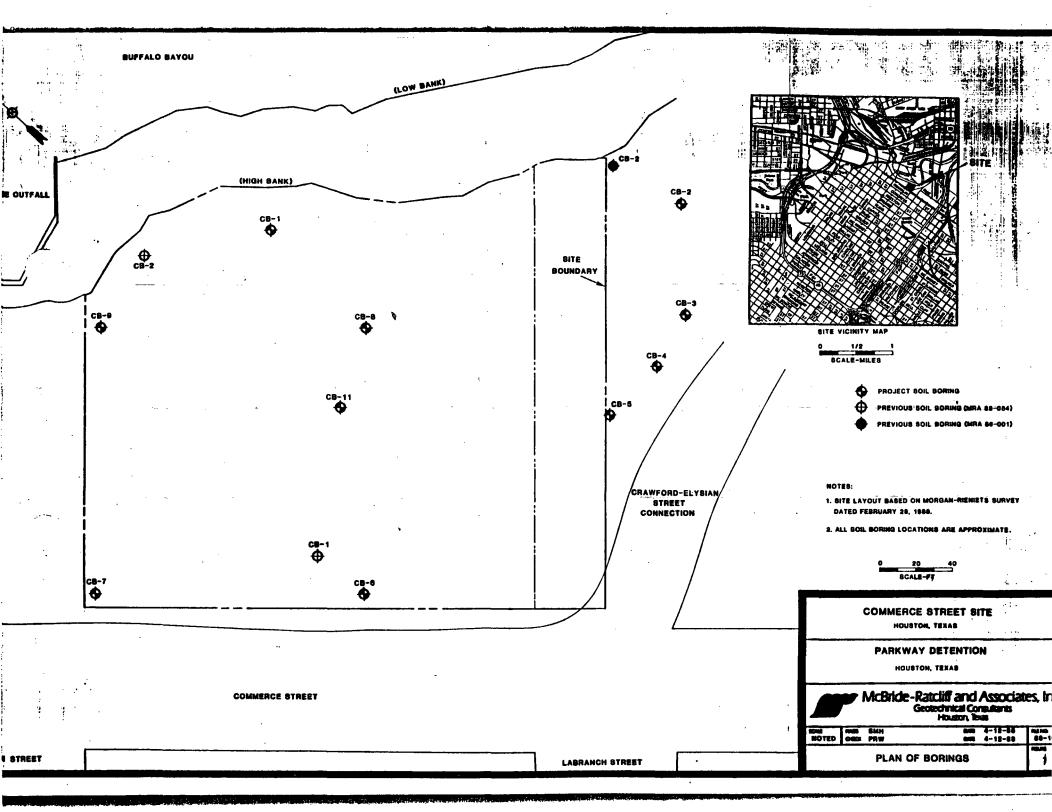

Project Description

The Commerce Street Site includes about 1.4 acres located near the Central Business District in Houston, Texas. The site is bounded by Commerce Street to the south, Buffalo Bayou to the north, and the Elysian Street Viaduct located to the east. The site has been proposed as the location of an extension to the Harris County Sheriff's Department and County Jail.

A preliminary environmental site assessment was conducted to evaluate the potential for environmental risks associated with former site operations and possible site impacts from adjacent site operations. A site location map is presented on Figure 1.

Background

A preliminary geotechnical evaluation of the Commerce Street Site was conducted by McBride-Ratcliff and Associates (MRA) and included drilling two exploratory soil borings (MRA Report No. 88-084, dated March 1, 1988). Results of the preliminary geotechnical evaluation indicated the presence of organic vapors in recovered soil samples. An adjacent soil boring located near the site was drilled for another geotechnical study and disclosed the presence of possible subsurface hydrocarbons (MRA Report No. 86-001, dated April 20, 1987). In addition, a preliminary review of the Texas Water Commission (TWC) Town Gas Sites file indicated that the Commerce Street Site may have been associated with a former town gas facility and

therefore future regulatory actions may be planned. In response to these items, a preliminary environmental site assessment was conducted to evaluate the potential for environmental risks.

Approach

The primary objective of the preliminary environmental site assessment was to provide an evaluation of the potential for environmental risks. Specifically, our approach was based upon obtaining and analyzing limited soil samples for coal tar derivatives and PCBs as an indication of the presence or absence of subsurface organic contaminants.

Scope of Work

The scope of work for the preliminary environmental site assessment was organized into four primary work tasks that are described as follows:

<u>Task 1 - Site History</u>. Task 1 included a review of the following three data sources to obtain initial information pertaining to the site history:

- 1. Houston library archives
- 2. Texas Water Commission (TWC)
- 3. Historical aerial photographs

Site historical information was reviewed to assist in developing the preliminary phase sampling and analytical program and further aided in evaluating the general character of the site.

Task 2 - Field Exploration. Task 2 included drilling ten soil borings throughout the depth of the on-site fill materials and into natural soils to obtain soil samples for subsequent analytical testing and to characterize subsurface soil conditions.

Task 3 - Laboratory Testing. Laboratory headspace measurements were obtained with a portable photoionization detector to assist in selecting soil samples to be composited for subsequent analytical testing. A total of five soil samples (4 composite soil samples and 1 blind duplicate sample) were analyzed for the following EPA Hazardous Substance List (HSL) constituents:

<u>Item</u>	<u>Constituents</u>
Semivolatile Organics (base/neutral/acid extractables)	69
Pesticides/PCBs	27

<u>Task 4 - Report</u>. Results from Tasks 1 to 3 are documented in this engineering report. The report includes descriptions of the field and analytical testing procedures and specifically addresses the following items:

- 1. General site history and regulatory status.
- 2. Fill conditions, including the depth and nature of the fill materials.
- 3. Soil analytical test results.

SITE HISTORY

Houston Library Archives

Copies of historical Sanborn fire insurance maps were obtained from the City of Houston Library archives for the years 1890 and 1950. The maps were reviewed to obtain data concerning previous site activities, surface features of potential environmental concern, and previous site and nearby site owners.

Texas Water Commission Files

Contact was made with representatives of the Texas Water Commission (TWC) concerning the TWC Town Gas Project, because of the possibility of association with former "town gas" facilities. Additionally, TWC Houston town gas site files were also reviewed to obtain data concerning current regulatory site status.

<u>Historical Aerial Photographs</u>

Historical aerial photographs were obtained from the U.S.D.A. Agricultural Stabilization and Conservation Services (ASCS) for the following years:

Year	Photograph Number	Approximate Scale
1953	BQY-13M-121D	1 in - 200 ft
1957	BQY-4T-138D	1 in - 200 ft
1964	BQY-3FF-147C	1 in - 200 ft
1973	48201-173-201D	1 in - 400 ft
1981	48201-281-126L	1 in - 400 ft

The historical aerial photographs were used to review the former site features and to assess the potential presence of surficial anomalies which could indicate former pits, storage tanks, or environmentally significant activities.

FIELD EXPLORATION

Soil Borings

A total of ten project soil borings were drilled during the preliminary environmental site assessment. Including three soil borings from previous MRA studies, a total of 13 soil borings were drilled to assess site and nearby subsurface soil conditions. The ten project soil boring depths ranged from 14-ft to 46-ft depths, whereas the three previous soil borings ranged from 30-ft to 80-ft depths. The soil boring locations are shown on Figure 1.

Dry-augering drilling techniques were used to advance the project boreholes. Cohesive samples were generally obtained by hydraulically advancing a 3-in. diameter, thinwalled steel Shelby tube at approximate 2-ft continuous intervals. Non-cohesive samples were generally obtained at approximate 1.5-ft continuous intervals by driving a 2-in diameter, steel split-spoon barrel sampler using a 140-1b hammer dropped about 30 inches. Upon completion, project soil borings were pressure-grouted with a cement-bentonite grout from the bottom of each borehole to the surface to reduce the potential for strata cross-contamination. Excess soil cuttings from the boreholes were collected and placed into metal drums and transported to our Houston laboratory for disposal (small quantity hazardous waste generator exemption).

Soil Sampling

Recovered soil samples were visually field-classified by our geologist. The samplers were cleaned between each sampling interval with a detergent wash followed by a

Field headspace measurements of soil methanol rinse. organic vapors were made with a portable photoionization Notations of soil discolorations and odors were Recovered soil samples were placed into deterrecorded. gent-washed glass jars with Teflon-lined lids and stored on ice in portable coolers for transport to our Houston laboratory with chain-of-custody documentation. All field activities were conducted in accordance with an OSHA site safety plan (29 CFR 1910.120). Project soil boring logs are presented in Appendix A and include our interpretations of general subsurface conditions at the soil boring locations. Soil classifications presented on the soil boring logs are based on visual field classification and have not been verified by laboratory soil testing. Previous on-site soil boring logs are included in Appendix B.

LABORATORY TESTING

Laboratory testing of selected soil samples included sample headspace measurements of total organic vapors for sample screening and analytical testing for organic compounds.

Sample Screening

In addition to visual classification, recovered soil samples were screened for total organic vapors. Headspace total organic vapor concentrations were obtained in the MRA laboratory with an isobutylene-calibrated HNU PI 101 photoionization detector equipped with a 10.2 eV lamp. The majority of aromatic hydrocarbon compounds have ionization potentials less than 10.2 eV and are therefore generally detectable by photoionization techniques. Results of the soil organic vapor measurements are summarized on the soil boring logs presented in Appendix A and are presented as naphthalene-equivalent concentrations.

The soil organic vapor screening results are reported as total organic vapors, based on a conversion factor to naphthalene equivalents. Naphthalene is a polynuclear aromatic hydrocarbon (PAH) commonly found in coal tars, coal tar distillates, and some petroleum distillates.

The headspace measurement results are for sample screening purposes only to assist in selection of soil samples for subsequent analytical testing, and are used only to assess the potential presence of contaminants. Precise quantitative analysis of volatile organic compounds is not applicable to photoionization detection screening methods and depends on temperature, vapor pressure, ionization potential, headspace volume, etc. The photoionization detector will also detect some trace inorganic gases that may not be suitable for contaminant indicators.

Analytical Testing

Based on the results of the soil organic vapor screening and field sampling notations, discrete soil samples were selected and composited into five soil samples, including one duplicate, for subsequent analytical testing. The duplicate soil sample was analyzed as a quality assurance measure to assess the reproduceability of intra-laboratory data. Listed as follows is the summary of the selected soil samples, their corresponding composite sample number, and the general soil strata from which they were obtained.

Analytical Soil Testing Summary

Sample No.	Soil Boring/Depth (ft.)	<u>Strata</u>
1. Composite 2	CB-2, 9-11	Fill
	CB-2, 11-13 CB-2, 13-15	Fill Fill

Sample No. Soil I	Boring/Depth (ft.)	Strata
2. Composite 4	CB-4, 6-8	Fill
	CB-4, 10-12	Fill '
	CB,-4, 12-14	Fill
3. Composite 5A	CB-5, 30-32	Natural Clays
·	CB-5, 32-34	Natural Clays
	CB-5, 38-40	Natural Clays
4. Composite 5B	CB-5, 42-43	Water-Bearing Sand
	CB-5, 44-46	Water-Bearing Sand
5. Composite 56C	CB-5, 30-32	Natural Clays
(Composite 5A Duplicate)	CB-5, 32-34	Natural Clays
	CB-5, 38-40	Natural Clays

Analytical test assignments were based upon sample selections with (1) positive headspace screening; (2) visual and olfactory responses; and (3) key geologic strata representing both the fill soils and the natural soils.

The composited soil samples were analyzed for EPA Hazardous Substance List (HSL) semivolatile organic compounds (69) and pesticides/PCBs (27) by MBA Labs in Houston, Texas. HSL semivolatile compounds were selected for analysis based upon our experience that coal tar constituents are typically detected in this fraction. PCBs were also selected for analysis based upon our experience that PCBs were commonly used by the electric power industry as a constituent of cooling and lubricating oils. Historical data indicates the past presence of both on-site underground oil tanks and adjacent-site coal tar piles (coke). Results of the laboratory testing are included in Appendix C.

FINDINGS

Our preliminary interpretations of subsurface conditions are based upon information at the boring locations only and relatively limited, select soil samples. This information has been used as the basis for our preliminary conclusions. However, significant variations in subsurface conditions at areas not explored by soil borings and in samples not selected for analytical testing may be present and will require re-evaluation of our conclusions.

Site History

A review of the historic Sanborn fire insurance maps indicates that the Houston Electric Company was previously located at the Commerce Street site. Features from Houston Electric Company identified from the maps include an elevated water tank, underground oil tanks, a crude oil tank, a generating unit, and a machine shop. Coke piles and an underground oil tank are shown adjacent to the east border at the Houston Gas & Fuel Company Site.

Conversations with representatives of the Texas Water Commission (TWC) indicate that the Houston Gas and Fuel Company previously operated a 4-acre site located south of Ruiz (Magnolia) between LaBranch and Crawford, north of Commerce. This site is located adjacent to the east boundary of the Commerce Street Site. The former Houston Gas and Fuel Company Site was included with the TWC Town Gas Project. The Town Gas Project was initiated because of possible environmental concerns from "town gas" facilities which used coal to produce fuel for illuminating street lamps. It was common practice to dispose of the coal tar by-products created during the heating (or gasification) of coal into unlined on-site disposal pits. Based on verbal

information from TWC, it does not appear that the Commerce Street Site was included with the Houston Gas and Fuel Town Gas Site.

A review of TWC files indicates that a site visit of the Houston Gas and Fuel Site was conducted by the TWC on December 5, 1986. Results of the site visit indicate that the current (1986) owner/operator of the property on which the town gas site was located is Entex Gas Company. A site inspection was conducted by the EPA on June 19, 1987 and concluded that because no historical or visual evidence of on-site disposal sites was noted, no further regulatory investigative action was recommended.

A review of the 1953 Agricultural Stabilization and Conservation Service (ASCS) photograph indicates that the site was primarily vegetated with low-lying brush and a few trees at the time of the aerial reconnaissance. commercial or industrial activities or buildings are evident, nor do there appear to be fill piles or open However, some commercial and/or industrial activity is evident in the 1959 ASCS photograph. Access roads and apparent railroad freight cars or truck trailers are evident throughout the majority of the site. The site was apparently largely unused by 1964, which is evident by the relative absence of railroad freight cars or truck trailers, except for those adjacent to Commerce Street. 1973 ASCS photograph indicates that the site was abandoned. based on the lack of railroad freight cars or truck The 1981 ASCS photograph trailers and access roads. indicates that the site had been paved and was being used as a car parking lot. Our interpretations of the historical aerial photographs revealed no on-site surficial

anomalies potentially associated with former Houston Gas and Fuel Company or Houston Electric Company activities. However, the photographic coverage may post date the time of the former site operations.

Soil Stratigraphy

Data obtained from the field exploration program were used to prepare the soil boring logs presented in Appendix A and Appendix B. A review of the soil boring logs indicates that fill materials were encountered at both project and previous soil borings ranging from 9-ft to 33-ft depths. with an average fill depth of about 19 ft. Fill materials generally consisted of gray clays with some layers of tan and reddish brown silty clays intermixed with concrete. gravel, and asphaltic materials. Asphaltic materials were encountered in four soil borings along the northern and eastern site boundaries at about 11-ft to 13-ft depths (Borings CB-1 to CB-4). Oily residues were evident in the fill materials of two soil borings (Borings CB-1 and CB-4) at about 4-ft to 6-ft depths, and petroleum odors were noted in all soil boring fill materials. Four soil borings could not be advanced beyond about 14-ft to 16-ft depths due to subsurface obstructions (Borings CB-2, CB-3, CB-8, CB-11).

Soil borings located near the edge of the Buffalo Bayou high bank near the northeastern site boundary which penetrated through the fill materials (Borings CB-1 and CB-9) indicate a firm to medium tan silty sand from about 18 ft to below 33 ft. The soil boring log for the previous Boring CB-2 (86-084) indicates that the sand layer may extend to about 48 ft.

Project and previous soil borings located further away from Buffalo Bayou indicate layers of natural gray clays, silty clays, and sandy clays from approximately 16-ft to 35-ft depths (Borings CB-4, CB-5, CB-6, CB-7 and previous Boring CB-1). Boring CB-5 and previous Boring CB-2 (86-001) located near the eastern and northeastern site boundaries indicate a silty clay from about 33-ft to 42-ft. The soil boring logs for previous Borings CB-2 (86-001) and CB-2 (88-084) indicate layered sands, silts, and clays from about 40 ft to 80 ft.

Free water in open boreholes was encountered at about 28 ft to 34 ft. The water levels are interpreted to be depressed as a result of drawdown influences caused by proximity to Buffalo Bayou. The observed depth to water in the open boreholes during the time of our field exploration is recorded on the boring logs. Accurate determination of groundwater levels is usually made from open standpipe piezometers. Water levels measured in open boreholes may not accurately reflect true groundwater conditions and therefore should be only considered as approximate indications of groundwater levels. Generally higher groundwater levels are expected away from Buffalo Bayou.

Laboratory Testing

Results of the soil organic vapor screening indicate that sample headspace organic vapors were present in eight of 10 project soil borings, based on a criterion of 3 parts per million (ppm) naphthalene equivalents minimum photoionization detector response. Below 3 ppm naphthalene equivalents, the positive correlations between visual oily residues/asphaltic materials, olfactory responses, and photoionization detector responses were variable. The highest measured photoionization detector responses were

noted in Boring CB-5 soil samples, which had positive responses ranging from 11 ppm to 119 ppm naphthalene equivalents for soil samples from 30 ft to 42 ft. However, positive responses in project soil samples generally ranged from about 3 ppm to 20 ppm naphthalene equivalents, with a few project soil samples ranging up to 55 ppm. Generally, the two or three samples with the greatest responses from select soil borings were chosen for compositing and subsequent analytical testing. The higher headspace measurements were generally obtained from soil borings located near the eastern site boundary.

3 i

A summary of the analytical test results for detected constituents is presented in Table 1.

Table 1
Summary of Analytical Test Results (mg/kg) (ppm)

Pesticides/PCBs					
PCB-1254	0.001	0.013	0.002	0.116	0.290

The results of the analytical testing indicate that the predominant constituents in the tested soil samples were polynuclear aromatic hydrocarbons (PAH), which are typical

PAH concentrations ranged from 893 mg/kg for the Composite 5B soil sample to 12,394 mg/kg for the Composite 4 soil sample. PCB-1254 was also detected in each tested soil sample from 0.001 mg/kg for the Composite 2 soil sample to 0.290 mg/kg for the Composite 5A duplicate soil sample (Composite 56C). The MRA chemistry lab independently verified the presence of PCB-1254 in Composite 5A with a gas chromatograph-electron capture detector instrument using EPA Method 8080.

4

PRELIMINARY CONCLUSIONS

Based on our review of site historical data, field exploration data, and laboratory test data, the following preliminary conclusions are noted:

- 1. TWC files and Sanborn fire insurance maps indicate that the Commerce Street Site was formerly the site of the Houston Electric Company, which apparently used underground and above-ground oil storage tanks. The adjacent property was formerly occupied by the Houston Gas and Fuel Company, which produced coal tars as a by-product of coal gasification for fuel.
- 2. Our interpretation of ASCS historical aerial photographs does not indicate the presence of on-site surficial anomalies potentially associated with former Houston Electric Company and Houston Gas and Fuel Company operations. However, aerial photograph coverage may post date the time of the former site operations.

- The soil stratigraphy at depths less than about 40 ft 3. is variable throughout the site. The field exploration program indicates average fill material depths to about 19 ft, with fill material depths ranging from 9 ft to 33 ft. Black asphaltic materials were encountered at about 11-ft to 13-ft depths in four soil borings, overlain by soils that are relatively free of asphaltic and tar-substances. This may indicate that coal tars were previously disposed on-site and then covered by relatively clean construction debris and fill soils. A natural sand layer extends to a depth of about 48-ft throughout the northwestern portion of the site. A natural silty clay extends from about 33-ft to 42-ft depths along the northeastern portion of the site. sands, silts, and clays are present from about 40-ft to 80-ft depths. Free water in open boreholes was encountered at about 28-ft to 34-ft depths.
- 4. Based on olfactory and photoionization detector responses, soil borings throughout the site indicated the presence of organic vapors in fill materials and natural soils from about 3-ft to 48-ft depths. However, soil odors and headspace results within the shallow fill soils may indicate possible vapor-phase constituents emanating from deeper residual soil contaminants, such as oily residues and asphaltic materials. Positive photoionization detector responses were generally in the 3 ppm to 20 ppm range, with a maximum response of 119 ppm.
- 5. Laboratory testing detected the presence of PAH compounds and PCBs in both fill materials and natural soils, possibly indicating that vertical subsurface contaminant migration has occurred. The presence of

PAH compounds indicates that coal tar residuals remain in site fill materials. Insufficient data is available to assess the source of PCBs at the site.

Based upon our preliminary interpretations of the field and laboratory data, the average depth to residual fill soil contaminants (i.e., oily residues and asphaltic material) is estimated at 11 ft at four soil boring locations. Organic vapor concentrations and soil odors less than 11-ft depth may be attributed to vapor-phase constituents emanating from the deeper residual contaminants.

LIMITATIONS

This preliminary environmental site assessment was conducted to evaluate the potential for environmental risks and is based on analytical testing of limited, selected subsurface soil samples for organic compounds. Results of the analytical testing disclosed the presence of polynuclear aromatic hydrocarbons (PAH) and polychlorinated biphenyls (PCBs), which indicate the potential for environmental risks.

A detailed remedial investigation is necessary to define the extent and magnitude of the subsurface contaminants and thereby evaluate environmental risks. Environmental risk assessments typically include evaluation of contaminant migration pathways relative to exposure of contaminants to human, animal, and plant life. In the event environmental risks are indicated, then appropriate remedial measures can be assessed.

SOIL CLASSIFICATION CHART

UNIFIED SOIL CLASSIFICATION SYSTEM

RELATIVE DENSITY OF COHESIONLESS SOILS

COARSE GRAINED SOILS (major portion retained on No. 200 sieve); includes (1) clean gravels and sands, and (2) silty or clayey gravels and sands. Conditions rated according to standard penetration test (SPT) as performed in the field.

Descriptive Term	Blows Per Foot				
Very Loose	0 - 4				
Loose	5 - 10				
Firm	11 - 30				
Dense	31 - 50				
Very Dense	over 50				

^{*140} pound weight having a free fall of 30 inches.

CONSISTENCY OF COHESIVE SOILS

FINE GRAINED SOILS (major portion passing No. 200 sleve); Includes (1) inorganic and organic silts and clays, (2) gravelly, sandy, or silty clays, and (3) clayey silts. Consistency is rated according to shearing strength as indicated by penetrometer readings or by unconfined compression tests.

Descriptive Term	Unconfined Compressive Strength Ton/Sq. Ft.
Very Soft	Less than 0.25
Soft	0.25 to 0.50
Medium	0.50 to 1.00
Stiff	1.00 to 2.00
Very Stiff	2.00 to 4.00
Hard	4:00 and higher

NOTE: Slickensided and fissured clays may have lower unconfined compressive strengths than shown above, because of weakness or cracks in the soil. The consistency ratings of such soils are based on penetrometer readings.

TERMS CHARACTERIZING SOIL STRUCTURE

Slickensided

- having inclined planes of weakness that are slick and glossy in appearance.

Fissured

- containing shrinkage cracks, frequently filled with fine sand or silt; usually more or less vertical.

Laminated

- composed of thin layers of varying color and texture.

Interbedded

- composed of alternate layers of different soil types.

Caicareous

- containing appreciable quantities of calcium carbonate.

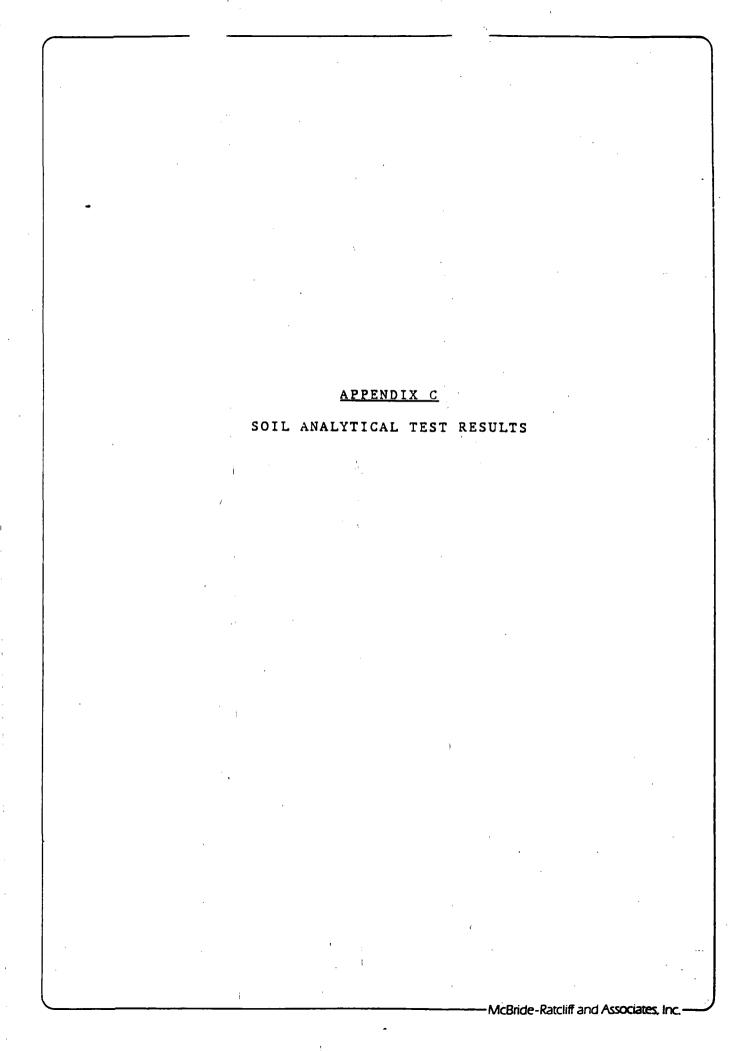

Well graded

having wide range in grain sizes and substantial amounts of all intermediate particle sizes.

Poorty graded

- predominantly of one grain size, or having a range of sizes with some intermediate size missing.

SAMPLE SUBMITTED BY:

McBRIDE-RATCLIFF

DATE RECEIVED:

3-17-88

DATE COMPLETED:

3-28-88

LABORATORY REPORT NUMBER:

J-11526-11530

SAMPLE IDENTIFICATION:

COMP#2, COMP#4, COMP#5A COMP#5B AND COMP#56C

THE SAMPLES WERE ANALYZED BY GAS CHROMATOGRAPHY/MASS SPECTROMETRY USING HEWLETT-PACKARD MODEL # 5970 GC/MS SYSTEMS.

THE SAMPLES WERE PREPARED FOR ANALYSIS ACCORDING TO THE METHODS DESCRIBED IN:

40 CFR PART 136, FEDERAL REGISTER, FRIDAY, OCTOBER 26, 1984 ENVIRONMENTAL PROTECTION AGENCY, PART VIII.

- 2. ACID/BASE-NEUTRAL METHOD 625
- 3. EPA MIX PESTICIDES METHOD 625
- 4. PCB'S (BY G.C.)METHOD 608

THE SAMPLES WERE ANALYZED FOR THE FOLLOWING COMPOUNDS:

EPA MIX PESTICIDES
ACID/BASE-NEUTRAL EXTRACTABLES

Ballesanen

BASE NEUTRAL/ACID EXTRACTABLES

THE GC/MS PARAMETERS WERE AS FOLLOWS:

COLUMN

25 METER FUSED SILICA CAPILLARY COATED WITH SE-30

HELIUM @ 30 CM/SEC(0.9 ML/MIN)

INJECTOR TEMP

270 DEGREES

COLUMN TEMP

CARRIER GAS

5 MINUTES @ 40 DEGREES, THEN 8 DEGREES PER MINUTE TO

300 DEGREES, HOLD AT 300 DEGREES.

INJECTION MODE SPLIT RATIO SPLITLESS

GC/MS INTERFACE

DIRECT

IONIZATION MODE

ELECTRON IMPACT

ELECTRON ENERGY 70 V

, MASS RANGE SCAN

35 TO 460 AMU

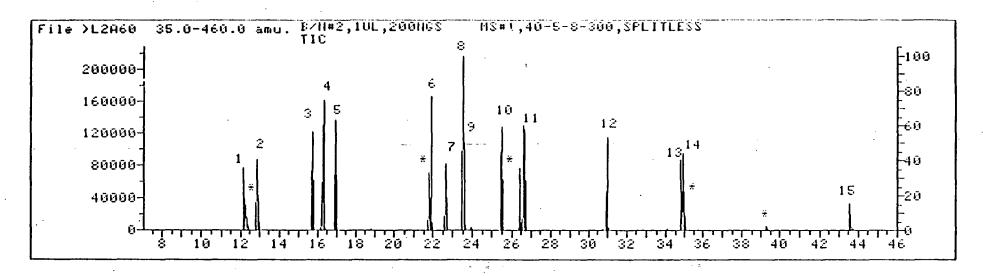

SCAN TIME

0.4 SEC

' COPIES OF THE TOTAL ION CHROMATOGRAMS ARE INCLUDED WITH THIS REPORT.

ALL GC/MS DATA IS PERMANENTLY STORED AT MBA LABORATORIES ON MAGNETIC
MEDIA.

BUREAU OF ECONOMIC GEOLOGY THE UNIVERSITY OF TEXAS AT AUSTIN AUSTIN, TEXAS 78712

PETER T. FLAWN, Director

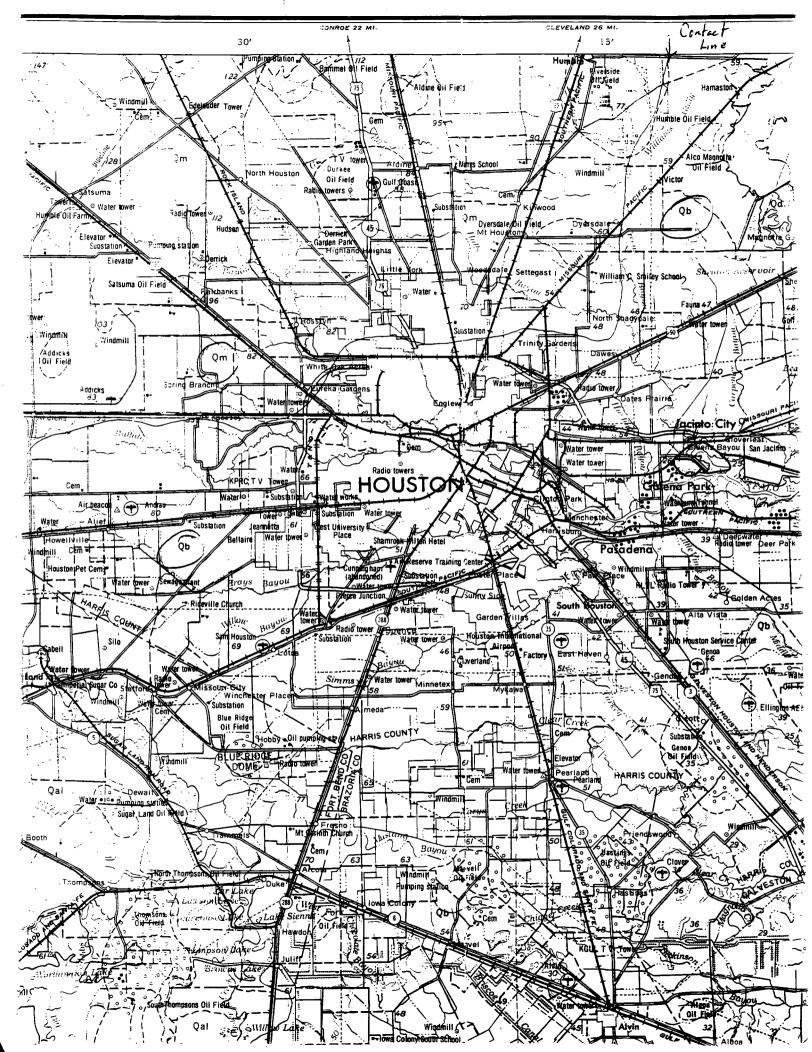

GEOLOGIC ATLAS OF TEXAS

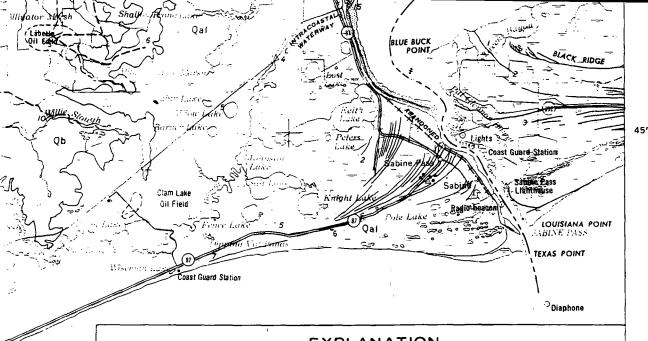

Houston Sheet

Scale: 1:250,000

February 1968

EXPLANATION

SEDIMENTARY ROCKS

Fill and spoil

Fill. F, material dredged for raising land surface above alluvium and barrier island deposits and for creating land. Spoil, S, dredged material forming islands along waterways

Alluvium

Clay, silt, and sand, organic matter abundant locally; includes point bar, natural levee, stream channel, backewamp, coastal marsh, mud flat, and narrow beach deposits, the last shown by line symbol

Barrier island deposits

Sand, silt, and clay; mostly sand, well sorted, fine grained abundant shells and shell fragments; interfingers with clay and silt in landward direction; includes beach ridge, spit, tidal channel, tidal delta, and sand dune deposits.

Deweyville Formation

Sand, silt, and clay, some gravel: includes point bar, natural levee, stream channel, and backewamp deposits at a level only slightly above that of the present flood plain; sand coarser than in alluvium; surface characterized by relict meanders of much larger radius of curvature than those of present streams, some scattered pimple mounds; thickness locally more than 50 feet. High level Deweyville surfaces cut in the Beaumont Formation and high level Deweyville deposits along Trinity River are intermediate in position between the Beaumont surface and the level of most Deweyville deposits

Beaumont Formation

Beaumont Formation, Qb, with barrier island and beach deposits, Qbb, mapped separately. Beaumont Formation, Qb, mostly clay, silt, and sand; includes mainly stream channel, point bar, natural levee, and backswamp deposits and to a lesser extent coastal marsh and mud flat deposits; concretions of calcium carbonate, iron oxide, and iron-manganese oxides in zone of weathering; surface almost featurelese, characterized by relict river channels shown by meander patterns and pimple mounds on meanderbelt ridges, separated by areas of low, relatively smooth, featureless backswamp deposits without pimple mounds; thickness 100± feet. Barrier island and beach deposits, Qbb, mostly fine-grained sand normally without shell material; stages slightly higher than that of surrounding deposits, characterized by numerous pimple mounds and rounded depressions; probably part of "Ingleside" barrier island system; thickness less than 30 feet. (Prairie Formation is a more recent name for deposits in Louisiana equivalent to Beaumont Formation in Texas)

Montgomery Formation

Clay, silt, sand, and very minor siliceous gravel of granule and small pebble sise, gravel more abundant northwestward, locally calcarsous, concretions of calcium carbonate, iron oxide, and iron-manganese oxides common in some of weathering; fluviatile; surface fairly flat and featureless except for numerous rounded shallow depressions and pimple mounds; thickness 100 ± feet. (Upper part of Liesie Formation as previously mapped)

REPORT 190

ANALOG-MODEL STUDIES OF GROUND-WATER HYDROLOGY IN THE HOUSTON DISTRICT, TEXAS

Ву

Donald G. Jorgensen U.S. Geological Survey

This report was prepared by the U.S. Geological Survey under cooperative agreement with the Texas Water Development Board and the City of Houston

February 1975

Second Printing August 1975 the only significant relief is in the valleys of the streams. The land is generally treeless in the rural areas from Houston southeast to Galveston.

The climate of the Houston district is characterized by mild winters and hot summers. The lowest temperature recorded at Houston was 15°F (-9.5°C) and the maximum temperature was 108°F (42°C). The mean annual temperature is 69.2°F (20.6°C). The 30-year average (1931-60) rainfall at Houston was 45.95 inches (116.7 centimeters); monthly rainfall is distributed uniformly throughout the year.

The Houston district has a large and diversified industrial economy, but also has extensive agricultural developments. Large amounts of water are used by industry for processing and cooling purposes and by rice and cotton growers for irrigation. The rapid growth and development of the district are due in part to the availability of large amounts of inexpensive ground-water supplies. The locations of the major pumping areas are shown on Figure 2.

Previous Studies

Among the more comprehensive earlier reports describing the geology and hydrology of the Houston district is the report by Lang and others (1950). Pettit and Winslow (1957) summarized the igeology and ground-water resources of Galveston County. The relation of salt water to fresh ground water in Harris County was discussed by Winslow and others (1957). Land-surface subsidence and its relation to the withdrawal of ground water in the Houston-Galveston area was first reported by Winslow and Doyel (1954) and later by Gabrysch (1969).

Previous ground-water investigations were made in Waller County (Wilson, 1967); Liberty County (Anders and others, 1968); Montgomery County (Popkin, 1971); Fort Bend County (Wesselman, 1972); Brazoria County (Sandeen and Wesselman, 1973); and Chambers County (Wesselman, 1971). These studies provided relatively recent data on the ground-water resources and ground-water development in most of the Houston district exclusive of Harris and Galveston Counties.

A report containing data on ground-water withdrawals and water-level declines in Galveston and Harris Counties was prepared by Gabrysch (1972), and the role of groundwater in the development of the water system for the city of Houston was described in reports by Turner, Collie and Braden, Inc. (1966, 1972).

A report by Wood and Gabrysch (1965) describes the results of the first analog-model study of ground-water hydrology in the Houston district. The usefulness of the first analog model was limited because the simulations required that the aquifers be operated independently of each other and because the results of pumping in the western part of the area could not be simulated. Evaluation of the performance of the first model indicated that improvement in aquifer designation was needed and that the transmissivity of the aquifers and vertical leakage between the aquifers were not adequately modeled.

Acknowledgments

The author expresses his appreciation to Mr. D. E. VanBuskirk of the city of Houston Water Department and to the well owners and drillers who supplied pertinent information for this study. The aquifers in the district were mapped by John Wesselman, U.S. Geological Survey, and the model was designed and constructed by William Bruns, U.S. Geological Survey.

GEOHYDROLOGY

The geologic formations from which most of the ground water is pumped in the Houston district are composed of sedimentary deposits of gravel, sand, silt, and clay. The formations, from oldest to youngest, that form important hydrologic units are: The Catahoula Sandstone and Fleming Formation of Miocene age; the Goliad Sand of Pliocene age; the Willis Sand, Bentley and Montgomery Formations, and Beaumont Clay of Pleistocene age; and alluvium of Quaternary age (Table 1). Correlation of the hydrologic units from northern Montgomery County to the Gulf of Mexico is shown by the chart on Figure 3.

With exception of the alluvium and the Goliad Sand, the formations crop out in belts that are nearly parallel to the shoreline of the Gulf of Mexico. The younger formations crop out nearer the Gulf and the older ones farther inland. All the formations thicken downdip so that the older formations dip more steeply than the younger ones. Locally, however, the occurence of salt domes and faults may cause reversals of the regional dip and thickening or thinning of individual beds.

Salt domes are cylindrical structures resulting from the upward movement of salt masses that are probably of Mesozoic age. In some areas, the salt domes penetrate the uppermost aquifer and nearly reach the surface. In most instances, however, the domes pierce only the lower aquifers. Ground-water circulation within the vicinity of the domes may result in salt water contamination.

Faults in the area may have several hundred feet of displacement in the older Tertiary formations, but displacement tends to decrease upward so that the faulting may not be apparent at the surface; generally, the geologic units containing fresh water are not displaced enough to disrupt hydraulic continuity.

Description of the Water-Bearing Units

Chicot Aquifer

The Chicot aquifer is composed of the Willis Sand, Bentley Formation, Montgomery Formation, Beaumont Clay, and Quaternary alluvium (Table 1). The Chicot includes all deposits from the land surface to the top of the Evangeline aquifer (Figure 4).

The basis for separating the Chicot aquifer from the underlying Evangeline aquifer is primarily a difference in hydraulic conductivity, which in part causes the difference in the altitudes of the potentiometric surfaces in the two aquifers.

In most of the Houston district, the Chicot aquifer consists of discontinuous layers of sand and clay of about equal total thickness, and in some parts of the district, the aquifer can be separated into an upper and lower unit. Throughout most of Galveston County and southeast Harris County, the basal part of the lower Chicot aquifer is formed by a massive sand section with high hydraulic conductivity. (See Figure 4.) This sand unit, which is heavily pumped, is known locally as the Alta Loma Sand. In many previous reports, the unit is identified as the Alta Loma Sand of Rose (1943). The term Alta Loma Sand is not often used in this report because the stratigraphic relationships are not clear.

If the upper unit of the Chicot aquifer cannot be defined in a particular area, the aquifer is said to be undifferentiated. The areal extent of the upper unit roughly corresponds to the areal extent of the Beaumont Clay. The areas in which the aquifer cannot be differentiated into units are mostly in the northern part of the district (Figure 5).

Wells that are completed in the uppermost sand layers of the Chicot aquifer and that have water levels that are distinctly higher than water levels in wells

completed in the underlying sand layers are considered to produce water from the upper unit.

The transmissivity of the Chicot aquifer ranges from zero to about 20,000 ft 2 /day (feet squared per day) or 1,858 m 2 /day (meters squared per day). The storage coefficient ranges from 0.0004 to 0.20 (Figure 6). The larger values of the storage coefficient occurs in the northern part of the district where the aquifer is partly or totally under water-table conditions.

Evangeline Aquifer

The Evangeline aquifer, which is the most important source of fresh ground water in the Houston metropolitan area, consists of layers of sand and clay that are present throughout the district except where the unit is pierced by salt domes (Figure 7). The aquifer is underlain by the Burkeville confining layer.

The transmissivity of the Evangeline aquifer ranges from less than 5,000 ft²/day (460 m²/day) to about 15,000 ft²/day (1,400 m²/day). (See Figure 8.) In general, the horizontal hydraulic conductivity of the Evangeline aquifer is less than the horizontal hydraulic conductivity of the Chicot aquifer, but because the Evangeline is generally thicker than the Chicot, it is generally more transmissive.

The storage coefficient of the Evangeline ranges from about 0.0005 to 0.0002 where it occurs under artesian conditions; in the outcrop area, where the aquifer is under water-table conditions, the storage coefficient ranges from greater than 0.002 to 0.20.

Burkeville Confining Layer

The Burkeville confining layer, which in the outcrop area is in the upper part of the Fleming Formation of Tertiary age, is composed mostly of clay but contains some layers of sand. The Burkeville restricts the flow of water except where it is pierced by salt domes and in the northeastern part of the district where it contains many water-yielding sand layers. The Burkeville is underlain by the Jasper aguifer.

Declines in the Altitudes of the Potentiometric Surfaces

Records of ground-water withdrawals in the Houston district date back to 1887, and records exist for probably 90 percent of the total withdrawals.

RECORD OF COMMUNICATION	(Record of Item Checked Below) ✓ Phone CallDiscussionFiel ConferenceOther(Specify)	d Trip
To: Jim Bell*	From: Michael N. Mitchell FIT Geologist M.J.M.	Date: 1-17-91 Time:
		8:50 a.m.
SUBJECT: Current Ground	d Water Production - City of Houston	(TXD981918188)
SUMMARY OF COMMUNICATION	N	
I called Mr. Bell to de	termine how much of the City of Hous	ton's water
supply is from ground wa	ater and surface water. Mr. Bell to	ld me that
an average of 350 milli	on gallons per day are provided by g	round water
from wells, and that 36	O million gallons per day are suppli	ed by surface
water from Lake Houston	. Ground water supplies approximate	ly 50% of total
supply. Attached is a	list of City of Houston producton we	lls.

RECORD OF COMMUNICATION	(Record of Item Checked Phone CallDiscussionConferenceOther(Spec	_√_Field Trip							
To: Dana L. Barbie*	From: Michael N. Mitchell FIT Geologist	Date: 1-31-91							
·	M.N.M.	Time:							
SUBJECT: Water Wells Within a Four Mile Radius of the Houston Gas Light Company Site (TXD981918188)									
SUMMARY OF COMMUNICATION	[: :								
I met with Mr. Barbie ar	d requested information on	the location and							
descriptions of water we	lls within a four mile radio	us of the Houston Gas							
Light Company site. I	opied the locations of the	vells onto 7.5 Minute							
U.S.G.S. Topographic Map	s.								
The nearest drinking wat	er supply well is the City	of Houston, Central 21							
(65-13-905) which produc	es from the Evangeline aqui	fer between depths of							
747 and 1,990 feet. Nir	e drinking water supply wel	s were located within							
the four mile radius and	are listed below.								
65-13-905 - Central	21, 65-13-904-Central 20								
65-13-944 - Central	22, 65-22-103 - Scott Stree	et							
65-14-404 - Northea	st 5, 65-14-405 - Northeas	4							
65-21-302 - South e	nd 8, 65-21-306 - South end	11							
65-21-304 - Southwe	st 11								
*Dana L. Barbie is a Hydrologist, United States Geological Survey, Water Resources Division, 2320 LaBranch, Houston, Texas

LEGEND

LEGLIND						
	SPECIAL FLOOD HAZARD AREAS INUNDATED BY 100-YEAR FLOOD					
	ZONE A	No base flood elevations determined.				
	ZONE AE	Base flood elevations determined.				
	ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.				
	ZOŅE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths deter- mined. For areas of alluvial fan flooding; velocities also determined.				
	ZONE A99	To be protected from 100-year flood by Federal flood protection system under construction; no base flood elevations determined.				
	ZONE V	Coastal flood with velocity hazard (wave action): no base flood elevations determined.				
	ZONE VE	Coastal flood with velocity hazard (wave action): base flood elevations determined.				
	FLOODWAY AREAS IN ZONE AE					
	OTHER FLOOD AREAS					
	ZONE X	Areas of 500-year flood; areas of 100-year flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 100-year flood.				
	OTHER AREAS ZONE X Areas determined to be outside 500-year flood-p-ain.					
	ZONE D	Areas in which flood hazards are undetermined.				
	UNDEVELOF	PED COASTAL BARRIERS				
		Floodplain Boundary				
		Floodway Boundary				
		Zone D Boundary				
Line	STATES OF SECOND	Boundary Dividing Special Flood Hazard Zones, and Boundary Dividing Areas of Different Coastal Base Flood Elevations Within Special Flood Hazard Zones.				
 51	3~	Base Flood Elevation Line; Elevation in Feet*

NOTES

River Mile

This map is for use in administering the National Flood Insurance Program; it does not necessarily identify all areas subject to flooding, particularly from local crainage sources of small size, or all planimetric features outside Special Flood Hazard Areas. The community map repository should be consulted for possible undated flood hazard imformation prior to use of this map for property purchase or construction purposes.

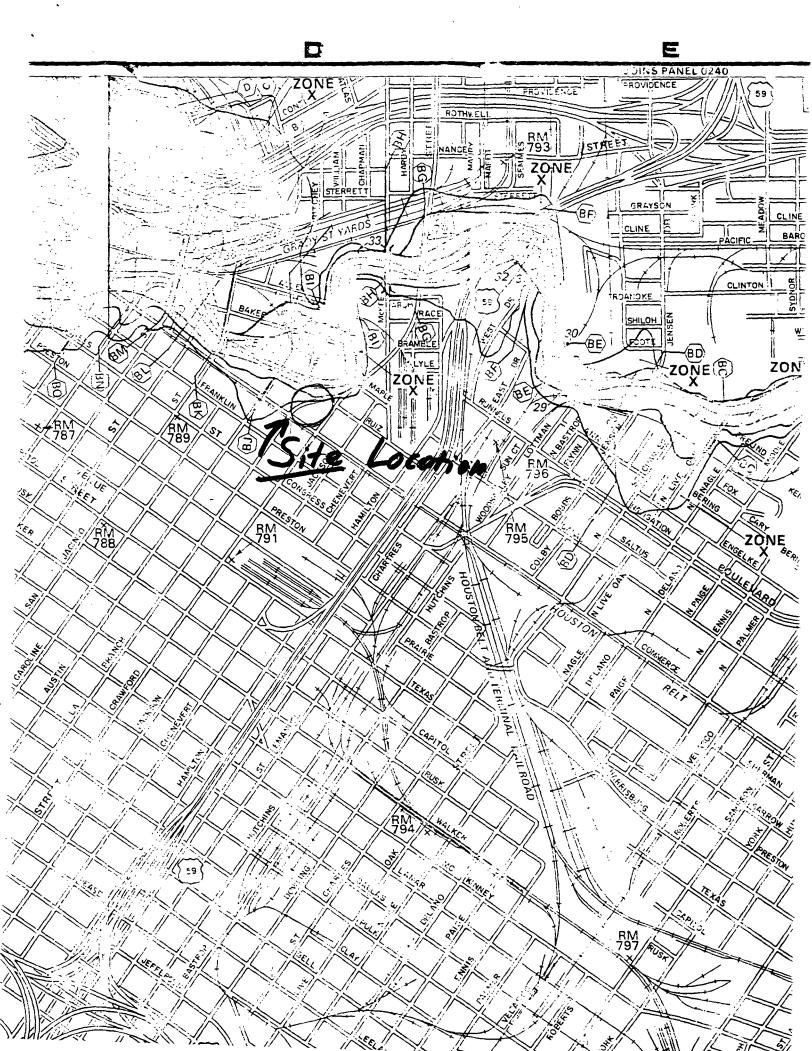

Coastal base flood elevations apply only landward of 0.0 NGVD, and include the effects of wave action; these elevations may also differ significantly from those on eloped by the National Weather Service for hurricane evacuation planning.

Areas of special flood hazard (100-year flood) include Zones A, AE, AH, AO, A99, $\rm V_{\rm c}$ and VE.

Certain areas not in Special Flood Hazard Areas may be protected by flood control structures.

Boundaries of the floodways were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the Federal Emergency Management Agency.

Floodway widths in some areas may be too narrow to show to scale. Floodway

SEGMENT	DESCRIPTION
1014	Buffalo Bayou Above Tidal - from a point 100 meters (110 yards) downstream of Shepherd Drive in Harris County to SH 6 in Harris County
1015	Lake Creek - from the confluence with the West Fork San Jacinto River in Montgomery County to a pont 4.0 kilometers (2.5 miles) upstream of SH 30 in Grimes County
1101	Clear Creek Tidal - from the confluence with Clear Lake in Galveston/Harris County to a point 100 meters (110 yards) upstream of FM 528 in Galveston/Harris County
1102	Clear Creek Above Tidal - from a point 100 meters (110 yards) upstream of FM 528 in Galveston/Harris County to Rouen Road in Fort Bend County
1103	Dickinson Bayou Tidal - from the confluence with Dickinson Bay 2.1 kilometers (1.3 miles) downstream of SH 146 in Galveston County to a point 4.0 kilometers (2.5 miles) downstream of FM 517 in Galveston County
1104	Dickinson Bayou Above Tidal - from a point 4.0 kilometers (2.5 miles) downstream of FM 517 in Galveston County to FM 528 in Galveston County
1105	Bastrop Bayou Tidal - from the confluence with Bastrop Bay 1.1 kilometers (0.7 mile) downstream of the Intracoastal Waterway in Brazoria County to Old Clute Road at Lake Jackson in Brazoria County
1107	Chocolate Bayou Tidal - from the confluence with Chocolate Bay 1.4 kilometers (0.9 mile) downstream of FM 2004 in Brazoria County to a point 4.2 kilometers (2.6 miles) downstream of SH 35 in Brazoria County
1108	Chocolate Bayou Above Tidal - from a point 4.2 kilometers (2.6 miles) downstream of SH 35 in Brazoria County to SH 6 in Brazoria County
1109	Oyster Creek Tidal - from the confluence with the Intracoastal Waterway in Brazoria County to a point 100 meters (110 yards) upstream of FM 2004 in Brazoria County
1110	Oyster Creek Above Tidal - from a point 100 meters (110 yards) upstream of FM 2004 in Brazoria County to the Brazos River Authority diversion dam 1.8 kilometers (1.1 miles) upstream of SH 6 in Fort Bend County
1111	Old Brazos River Channel - from the confluence with the Intracoastal Waterway in Brazoria County to SH 288 in Brazoria County

TEXAS WATER COMMISSION Rule Change

§§307.1-307.10
Texas Surface Water Quality Standards

Effective: April 29, 1988

- 1. <u>Purpose</u>. This change transmittal provides the pages that reflect changes and additions to the Texas Water Commission Volume of Permanent Rules.
- Explanation of Change. The Texas Water Commission (TWC or commission) adopted the repeal of existing 31 Texas Administrative Code §§307.1-307.3 and new §§307.1-307.10. Section 307.1 and §307.2 were adopted without changes. Sections 307.3-307.10 were adopted with changes to the proposed text published in the October 9, 1987 issue of the Texas Register (12 TexReg 3642). The previous surface water quality standards were set forth in §§333.11-333.21 and §§307.1-307.3. The standards that appear in §§333.11-333.21 no longer exist under the terms of Senate Bill 249, 69th Legislature (1985) subsequent to the adoption of new §§307.1-307.10, which replace those previous Texas Water Development Board Rules. This adoption was published in the April 15, 1988 issue of the Texas Register (13 TexReg 1776).

- (33) Total suspended solids Total suspended matter in water, which is equivalent to nonfiltrable residue.
- (34) Total toxicity Toxicity as determined by exposing aquatic organisms to samples or dilutions of instream water or treated effluent. Also referred to as whole-effluent toxicity.
- (35) Toxicity The occurrence of lethal or sublethal adverse effects on representative, sensitive organisms due to exposure to toxic materials. Adverse effects caused by conditions of temperature, dissolved oxygen, or nontoxic dissolved substances are excluded from the definition of toxicity.
- (36) Toxicity biomonitoring The determination of total toxicity.
- (37) Water quality management program The commission's overall program for attaining and maintaining water quality consistent with state standards, as authorized under the Texas Water Code, the Texas Administrative Code, and the Clean Water Act, §\$106, 205(j), 208, 303(e) and 314 (33 United States Code 1251 et seq).
- (38) Zone of initial dilution The small area at the immediate point of discharge where initial dilution with receiving waters occurs, and which may not meet certain criteria applicable to the receiving water. A zone of initial dilution is substantially smaller than a mixing zone.
- (b) Abbreviations. The following abbreviations apply to this chapter:
 - (1) AP aquifer protection.
 - (2) BMP best management practices.
 - (3) AS agricultural water supply.
 - (4) CFR Code of Federal Regulations.
 - (5) CR contact recreation.

\$\$307.1-307.10

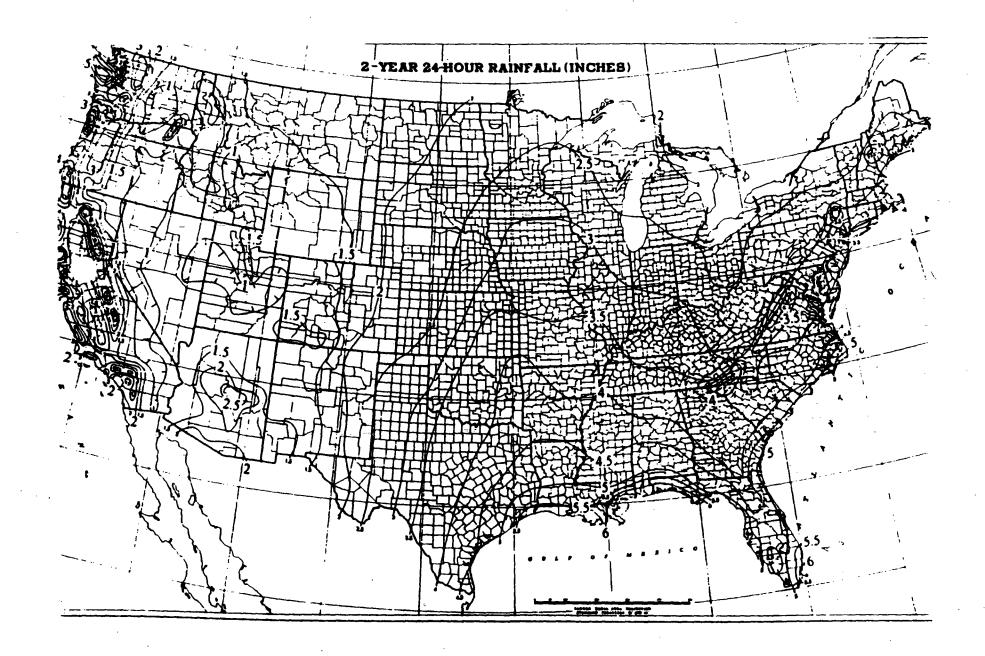

- (6) CPP continuing planning process.
- (7) DO dissolved oxygen.
- (8) E exceptional quality aquatic habitat.
- (9) EPA U.S. Environmental Protection Agency.
- (10) °F degree(s) Fahrenheit.
- (11) ft3/s cubic feet per second.
- (12) H high quality aquatic habitat.
- (13) I intermediate quality aquatic habitat.
- (14) IS industrial water supply.
- (15) L limited quality aquatic habitat.
- (16) mg/L milligrams per liter
- (17) ml milliliter.
- (18) N navigation.
- (19) NCR noncontact recreation.
- (20) NPDES National Pollutant Discharge Elimination System, as set out in the Clean Water Act, §402 (33 United States Code 1342).
- (21) O Oyster waters.
- (22) PQL practical quantitation level.
- (23) PS public water supply.
- (24) 7Q2 seven-day, two-year low flow.
- (25) TDS total dissolved solids.
- (26) USGS U.S. Geological Survey.
- (27) WQM water quality management.

INTEROFFICE MEMORANDUM

File TO:

Michael N. Mitchell, FIT Geologist M.M.M. FROM:

DATE: December 9, 1990

SUBJECT: On-Site Reconnaissance

During the course of the on-site reconnaissance, it was learned ENTEX operates a natural gasmetering and distribution at the site. The area is commercial/light industrial. Runoff is diverted from the site by city storm water drainage system.

November 30, 1990

W. L. Clayton Senior Vice President

Mr. Ed Sierra (FIT-RPO) USEPA Region 6 Hazardous Waste Section (6E-SH) 1445 Ross Avenue, Suite 1200 Dallas, Texas 75202-2733

Dear Mr. Sierra:

Attached is the "Consent for Access to Property" form for the Houston Gas Light Company site at 1515 Commerce, Houston, Harris County, Texas. I have revised the form to indicate my name and title so that future communications can be expedited.

Yours very truly,

WLC:gs

CONSENT FOR ACCESS TO PROPERTY

Name: William L. Clayton, Senior Vice President, Entex, P. O. Box 2628, Houston, TX 77252-2628

Houston Gas Light Company Site at 1515 Commerce, Houston, Harris County, Texas.

I hereby consent to Ecology and Environment, Inc. and/or their subcontractor, ICF Kaiser Engineers, duly authorized consultants of the United States Environmental Protection Agency (EPA) entering and having continued access to the property described above for the following purposes:

- Reviewing and copying documents related to Houston Gas Light Company;
- 2. The collection of soil, water, and air samples;
- 3. The sampling of any solids or liquids stored or disposed on the property;
- 4. The drilling of holes and installation of monitoring wells for subsurface investigations;
- 5. Other actions related to the investigation of surface and subsurface contamination.

I realize that these actions are undertaken pursuant to EPA's response and enforcement responsibilities under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), 42 U.S.C. Sections 9601-9626; and the Resource Conservation and Recovery Act (RCRA), 42 USC Section 6297.

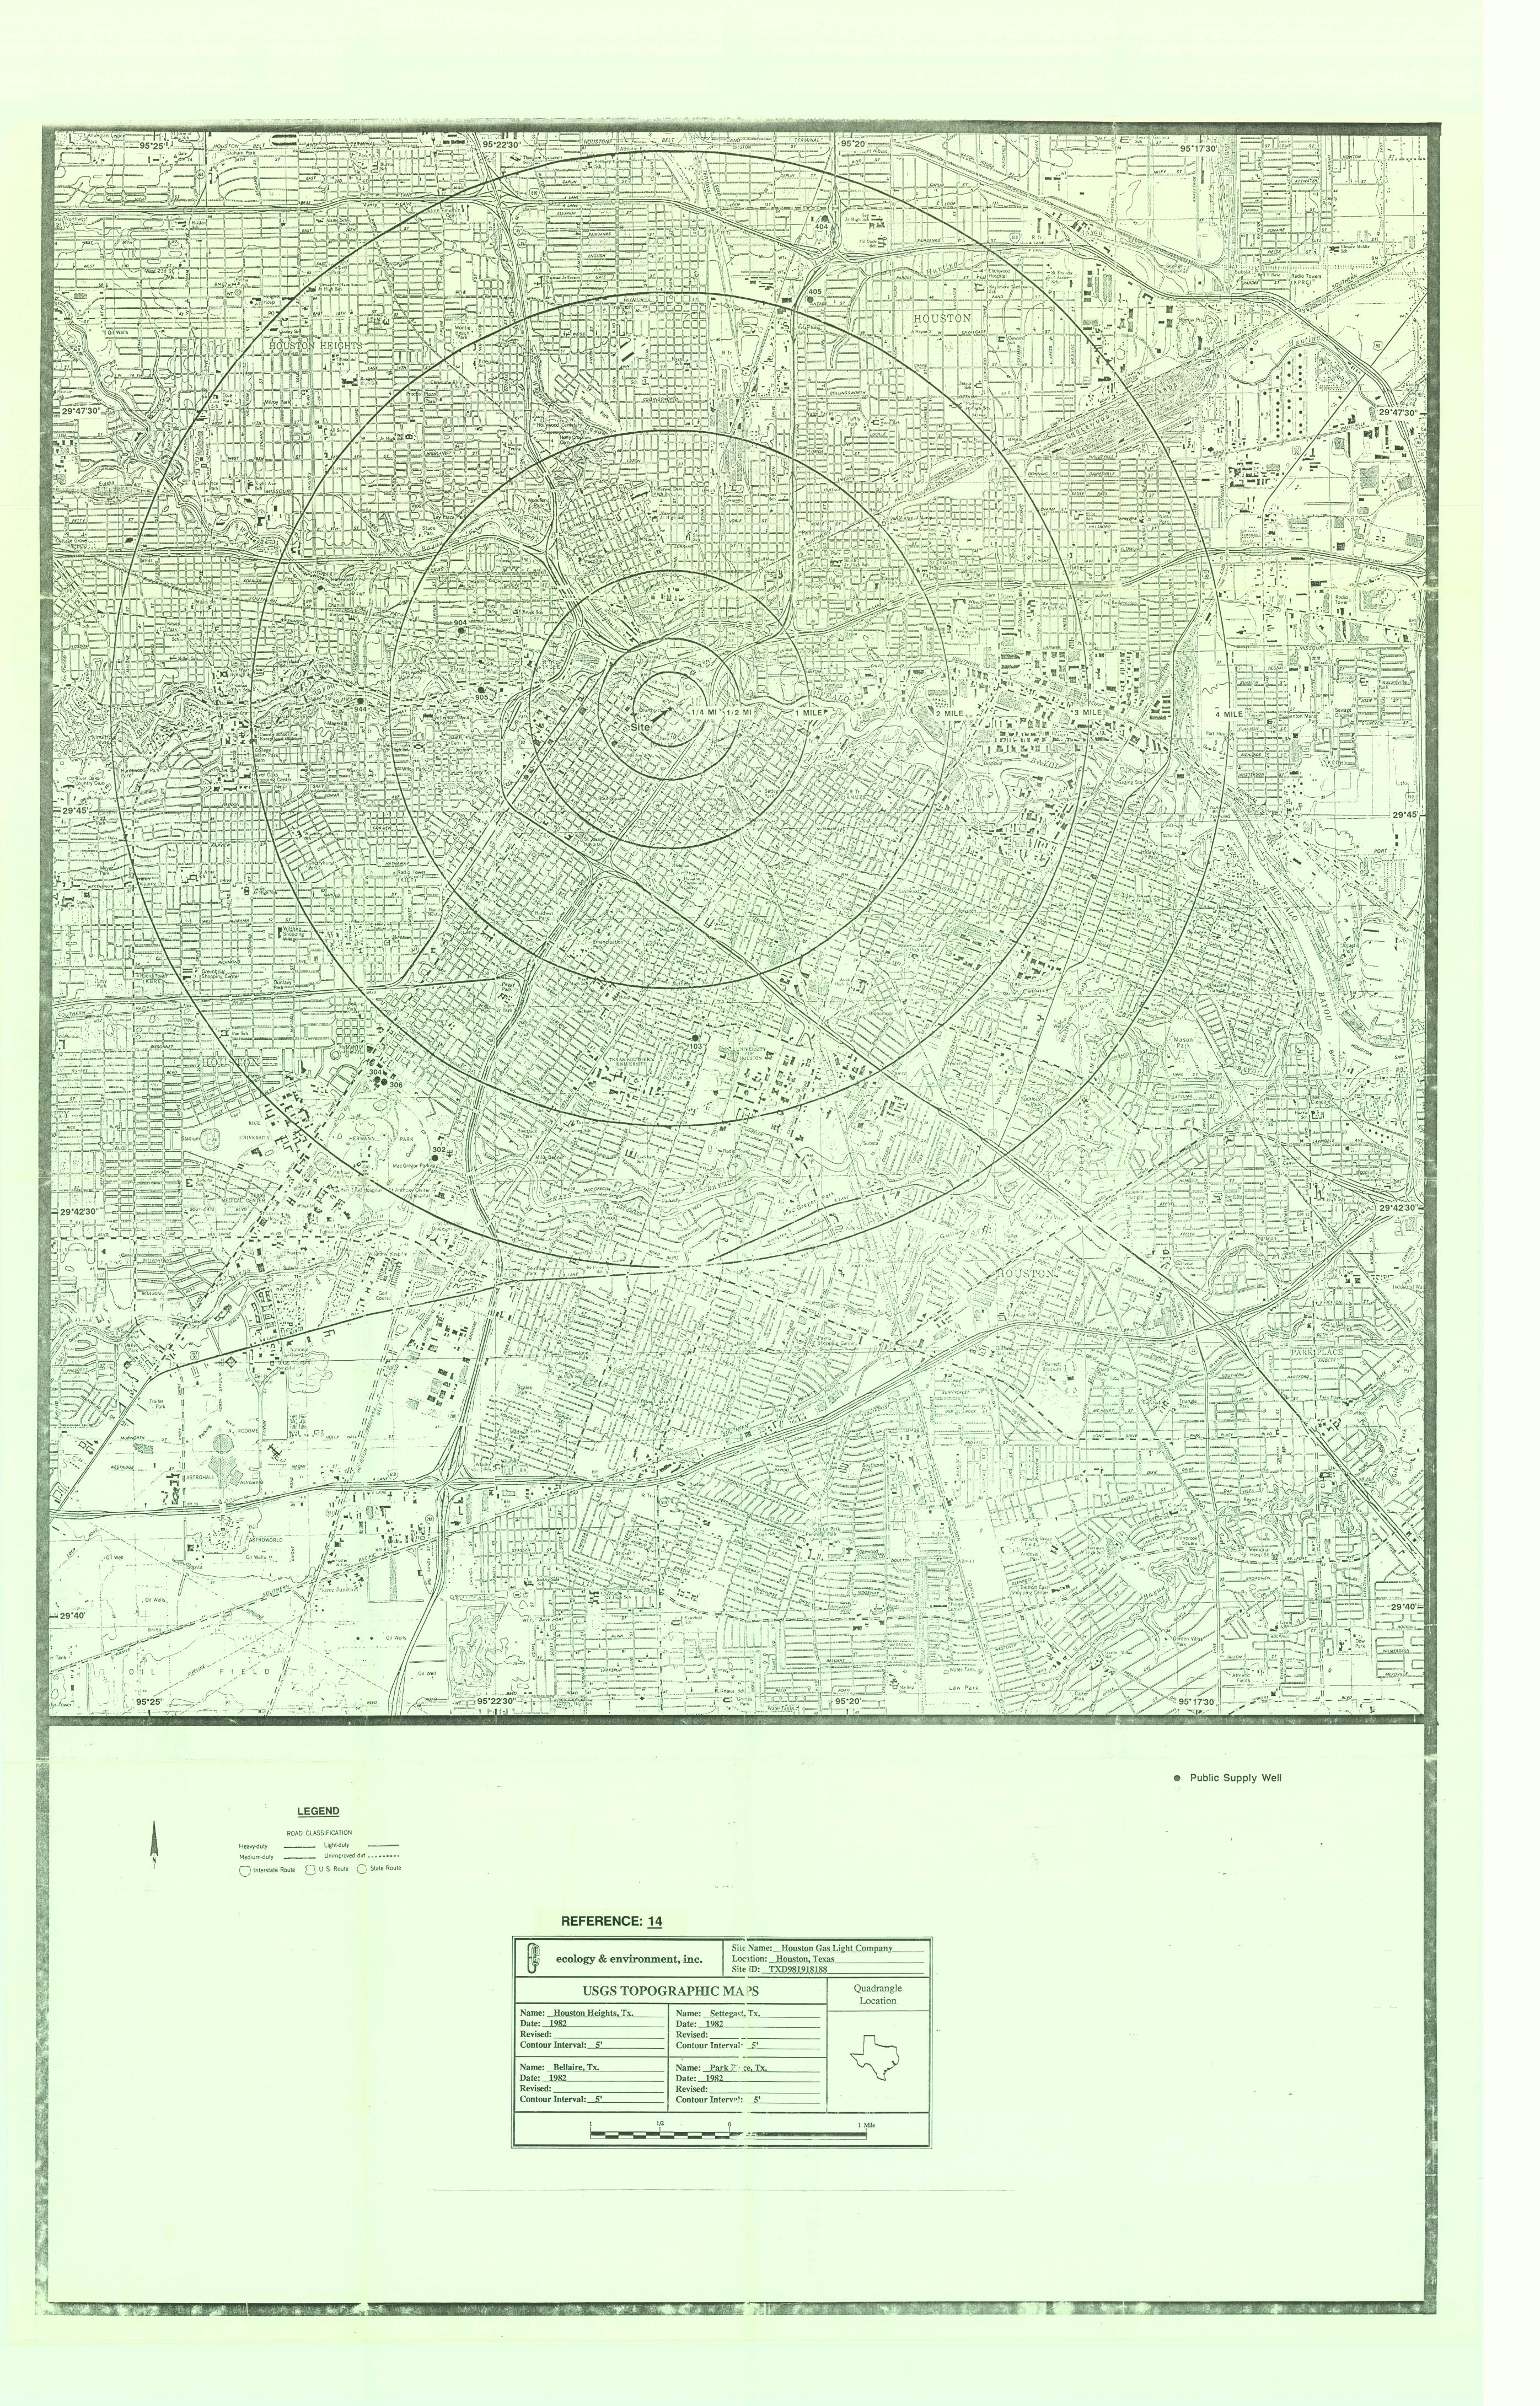

I am the property owner, or a responsible official of the property owner, and I warrant that I have the authority to make this access agreement.

This written permission is given by me voluntarily with knowledge of my right to refuse and without threats or promises of any kind.

11/30/90 Date Signatur

Place a check mark in the appropriate space. Please note that if no space is marked EPA will treat your failure to mark a space as your statement that you do not wish to be provided with a portion of each sample.

- Please provide me with a portion of each sample taken at the property described above. (There is no charge for the sample portions EPA provides you).
-) I do not wish to be provided with a portion of each sample taken at the property described above.
